Summary

In today's world, messaging systems play a crucial role in various industries, enabling effective communication and information exchange. However, it is crucial to make sure that communications are delivered in a dependable manner. The creation of an alert generation tool for messaging systems is necessary to address this. This report presents a Python-based solution that leverages MySQL, pandas, Twilio, and SMTP to create a robust alert generation system. The code presented in this report demonstrates the implementation of the alert generation tool, showcasing its capabilities in monitoring and analyzing messaging system performance. Through the integration of industry-standard technologies, this solution offers a scalable and adaptable approach for various real-life scenarios, enabling organizations to ensure reliable and efficient message delivery.
