About

Installation & Usage

The MagicMirror² can be installed manually or using automatic installers. At the start of 2020 the decision was made to remove the automatic installer from the MagicMirror² core repository and move it to a community maintained separate repository. For more information about this decision, please check issue [#1860](#) on GitHub.

Therefore the only officially supported way of installation is by using a [manual installation](#). Using external installation scripts is at your own risk but can make the process a lot easier. Available automatic installers can be found under: [alternative installation methods](#).

Manual Installation

1. Download and install a [required](#) *Node.js* version, see the official documentation:
 - [Linux based distributions](#)
 - [Others](#)
2. check if `git` is installed on your machine by executing `git` (should show usage), otherwise install it
3. Clone the repository: `git clone https://github.com/MagicMirrorOrg/MagicMirror`
4. Enter the repository: `cd MagicMirror`
5. Install the application: `npm run install-mm`

About

config/config.js

- Start the application: `npm run start`
For **Server Only** use: `npm run server`

NOTE

The installation step for `npm run install-mm` will take a very long time, often with little or no terminal response! For the RPi3 this is ~10 minutes and for the Rpi2 ~25 minutes. Do not interrupt or you risk getting a ❤️ by Raspberry Jam.

Alternative Installation Methods

The following installation methods are not maintained by the MagicMirror² core team. Use these scripts and methods at your own risk.

Automatic Installation Scripts

- Sam (@sdetweil, long time contributor of the MagicMirror² framework) maintains an easy-to-use installation and update script:
https://github.com/sdetweil/MagicMirror_scripts
- [The MagicMirror Package Manager](#) is a command line interface designed to simplify the installation, removal, and maintenance of MagicMirror modules.

About

Docker Image

- MagicMirror² can be deployed using Docker . Head over to this repository for more information.

Kubernetes Helm Chart

- If you want to run MagicMirror² (in server only mode) in a kubernetes cluster then take a look at this MagicMirror Helm Chart .

MagicMirrorOS

- This is a full OS based on Raspberry Pi OS. So instead of downloading Raspberry Pi OS and putting this on your sd card, you can use MagicMirrorOS instead. It runs out of the box with a default setup of MagicMirror, under the hood it uses the docker setup .

NPM

- We also publish the latest version of MagicMirror to the npm-registry .

About

Other Operating Systems

Windows

IMPORTANT

MagicMirror² is designed to run on Linux. But with an extra step in the installation process and a different start command, you can also run it on Windows. Some third-party modules may not work on Windows.

To get the software running on Windows, you have to do two things in addition to the [steps](#) above:

After step 5: Install dependencies in the vendor and font directories:

Powershell:

1. `cd fonts; npm install; cd ..`
2. `cd vendor; npm install; cd ..`

Command Prompt:

1. `cd fonts && npm install && cd ..`
2. `cd vendor && npm install && cd ..`

Otherwise the screen will stay black when starting the software.

Step 7: In Windows you must use `npm run start:windows` instead of `npm run start`.

Usage

Note the following:

About

run `start` & instead.

This starts the mirror on the remote display.

- If you want to debug on your Raspberry Pi you can use `npm run start:dev` which will start MM with *Dev Tools* enabled.
- To access the toolbar menu when in mirror mode, hit `ALT` key.
- To toggle the (web) Developer Tools from mirror mode, use `CTRL-SHIFT-I` or `ALT` and select `View`.

Server Only

In some cases, you want to start the application without an actual app window. In this case, you can start MagicMirror² in server only mode by manually running `npm run server`. This will start the server, after which you can open the application in your browser of choice. Detailed description below.

IMPORTANT

Make sure that you whitelist the interface/ip (`ipWhitelist`) in the server config where you want the client to connect to, otherwise it will not be allowed to connect to the server. You also need to set the local host `address` field to `0.0.0.0` in order for the RPi to listen on all interfaces and not only `localhost` (default).

About

```
3 default is "localhost"
4     port: 8080,    //
5 default
6     ipWhitelist:
["127.0.0.1",
":::ffff:127.0.0.1", ":::1",
":::ffff:172.17.0.1"], //
default -- need to add your
IP here

...
};
```

Client Only

This is when you already have a server running remotely and want your RPi to connect as a standalone client to this instance, to show the MM from the server. Then from your RPi, you run it with: `node clientonly --address 192.168.1.5 --port 8080` . (Specify the ip address and port number of the server)

Wayland

If you use Wayland. Run `npm run start:wayland` instead of `npm run start` to start.
