

1 Product Overview – AURA – Smart Mirror

The Aura Smart Mirror operates through AI technology to deliver individual updates for time displays alongside weather forecasts and dresses advice through tracking user expressions while delivering suitable motivational messages. The system provides both secure access control with facial recognition and continuous user experience through recognition.

2 Getting Started (Setting up Techniques)

The steps to activate and operating the Aura Smart Mirror include the following instructions:

1. Connect the Power Supplies:

- a. Insert the Raspberry Pi power cable into its power port.
- b. The Monitor power cable should be attached.

2. Wait for System Boot:

- a. Once power is activated the system will boot automatically while showing a QR code on the display screen.

3. Scan the QR Code:

- a. Scanning the code requires your smartphone camera function or any QR code scanner application.
- b. A browser window containing the Smart Mirror login interface will load after you scan the provided QR code.

4. Log In to Your Account:

- a. The account access requires the information given to you by your company representative.
- b. Your system will adapt itself through personalization after your initial login.

5. Change Your Password (Important):

- a. Your security requires you to change your password through the "Change Password" option after your first login within your dashboard.

6. Enjoy Your Smart Mirror:

- a. Once successful login takes place the Smart Mirror shows time updates and weather conditions and personalized motivational messages with outfits that match your current mood.
- b. The system identifies you by facial recognition and it scans emotions to enhance your mood.

3 Terms and conditions

1. License and Use:

- a. A personal or organizational license for the Aura Smart Mirror software comes from the distributing company.
- b. According to the license all unauthorized copying and redistribution activities with reverse engineering constitute a strict prohibition.

2. Data Privacy:

- a. Facial recognition features along with emotion detection operate exclusively to enhance user experience.
- b. The software processes facial information with emotions on a local level but it stores or sends no data unless users grant specific permissions.

3. Credentials and Access:

- a. Users need to maintain secret status for their registration information.
- b. Only authorized people who work for the system should access all data through its interface.

4. System Requirements:

- a. The system runs on Raspberry Pi computers with connected display displays.
- b. The system needs reliable power and internet access both for system upgrades and authentications.

5. Support:

- a. In case of support needs or technical difficulties please reach out to your company representative while you can also find support on the product website/support page.

6. Updates:

- a. The system can obtain enhanced versions which improve security and stability and feature quality. Regular internet accessibility should be maintained to ensure the mirror system receives updates.
